## Abstract

## 1 Introduction

In this paper we obtain existence of solutions for systems of equations of the type:

$$\begin{aligned} \frac{d}{dt} D_y L(t, u, u') &= D_x L(t, u, u') \quad \text{a.e. } t \in \mathbb{R}, T, \\ u' - uT &= u' - u'T = \mathbb{R}, \end{aligned} \quad (P)$$

where the function  $L : (\mathbb{R}, T] \times \mathbb{R}^d \times \mathbb{R}^d \rightarrow \mathbb{R}$ ,  $d \geq 2$  (called the *Lagrange function* or *lagrangian*) satisfying that it is measurable in  $t$  for each  $x, y \in \mathbb{R}^d \times \mathbb{R}^d$  and continuously differentiable in  $x, y$  for almost every  $t \in (\mathbb{R}, T]$ . The unknown function  $u : (\mathbb{R}, T] \rightarrow \mathbb{R}^d$  is assumed absolutely continuous.

Our approach involves the direct method of the calculus of variations in the framework of *anisotropic Orlicz-Sobolev spaces*. We suggest the articles [?] for definitions and main results on anisotropic Orlicz spaces, see also [?]. These spaces allow us to unify and extend previous results on existences of solutions for systems like (??).

**Keywords and phrases.** .

Through this article we say that a function  $\bullet : \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$  is of  $N_\infty$  class if  $\bullet$  is convex,  $\bullet \neq \neq$ ,  $\bullet y > \neq$  if  $y \neq \neq$  and  $\bullet - y = \bullet y$ , and

$$\lim_{\|y\| \rightarrow \infty} \frac{\bullet y}{\|y\|} = +\infty. \quad (1)$$

where  $\| \cdot \|$  denotes the euclidean norm on  $\mathbb{R}^d$ . From [?, Cor. 2.35] a  $N_\infty$  function is continuous.

Associated to  $\bullet$  we have the *complementary function*  $\|$  which is defined in  $\xi \in \mathbb{R}^d$  as

$$\|\xi\| = \sup_{y \in \mathbb{R}^d} \xi \cdot y - \bullet y \quad (2)$$

then, from the continuity of  $\bullet$  and (??), we have that  $\| : \mathbb{R}^d \rightarrow \mathbb{R} \cup \{\infty\}$ . Moreover, it is easy to see that  $\|$  is a convex function such that  $\|\neq\| = \neq$ ,  $\|-\xi\| = \|\xi\|$  [?, Chapter 2]. Moreover  $\|$  satisfies (??) (see [?, Th. 2.2]). i.e.  $\|$  is  $N_\infty$  function.

Some examples of  $N_\infty$  functions are the following.

*Example 1.1.*  $\bullet_p y := \bigcup_{i=1}^p p_i$ , for  $\neq < p < \infty$ . In this case  $\|\xi\| = \bigcup_{i=1}^q q_i$ ,  $q = p \wedge p - \neq$ .

*Example 1.2.* If  $\bullet : \mathbb{R} \rightarrow \mathbb{R} \cup \{+\infty\}$  is a  $N_\infty$  function on  $\mathbb{R}$  then  $\bar{\bullet} y = \bullet \|y\|$  is a  $N_\infty$  function on  $\mathbb{R}^d$ . In this example, as in the previous one, the function  $\bullet$  is *radial*, i.e. the value of  $\bullet y$  depends on the norm of  $y$  and not on its direction. These cases are not authentically anisotropic.

*Example 1.3.* An anisotropic function  $\bullet y$  depends on the direction of  $y$ . For example, if  $\neq < p_\neq, p_\neq < \infty$ , we define  $\bullet_{p_\neq, p_\neq} : \mathbb{R}^d \times \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$  by

$$\bullet_{p_\neq, p_\neq} y_\neq, y_\neq := \frac{\bigcup_{i=1}^{p_\neq} y_{\neq i}^{p_\neq}}{p_\neq} + \frac{\bigcup_{i=1}^{p_\neq} y_{\neq i}^{p_\neq}}{p_\neq}.$$

Then  $\bullet_{p_\neq, p_\neq}$  is a  $N_\infty$  function. In this case the complementary function is the function  $\bullet_{q_\neq, q_\neq}$  with  $q_i = p_i \wedge p_i - \neq$ .

More generally, if  $\bullet_k : \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$ ,  $k = \neq, \dots, n$ , are  $N_\infty$  functions, then  $\bullet : \mathbb{R}^d \times \dots \times \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$  defined by  $\bullet y_\neq, \dots, y_n = \bullet_\neq y_\neq + \dots + \bullet_n y_n$  is a  $N_\infty$  function. These functions are truly anisotropic, i.e.  $\bigcup_{i=1}^n x_i = \bigcup_{i=1}^n y_i$  does not imply that  $\bullet x = \bullet y$ .

*Example 1.4.* If  $\bullet : \mathbb{R} \rightarrow \mathbb{R} \cup \{+\infty\}$  is a  $N_\infty$  function and  $O \in GL_d, \mathbb{R}$ , then  $\bullet y = \bullet Oy$  is a  $N_\infty$  function.

*Example 1.5.* An anisotropic  $N_\infty$  function is not necessarily controlled by powers if it does not satisfy the  $\neq$  condition (see xxxxx). For example  $\bullet : \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$  defined by

$$\bullet y = \neq \pi \neq \bigcup_{i=1}^n y_i - \neq \text{ is } N_\infty \text{ function.}$$

The occurrence of Orlicz Spaces in this paper obeys to we will consider the following structure condition on the lagrangian:

$$\bigcup L \bigcup + \bigcup \nabla_x L \bigcup + \bigcup \nabla_y L \leq ax \bigcup bt + \bullet \frac{y}{\lambda}, \quad (S)$$

for a.e.  $t \in (\mathbb{T}, T]_\downarrow$ , where  $a \in C \mathbb{R}^d$ ,  $(\mathbb{T}, +\infty)$ ,  $b \in L^{\mathbb{Q}}(\mathbb{T}, T]_\downarrow, (\mathbb{T}, +\infty)$ .

Our condition (??) includes structure conditions that have previously been considered in the literature. For example, it is easy to see that, when  $\bullet x$  is as in Example ??, then the condition (??) is equivalent to the structure condition in [?, Th. 1.4]. If  $\bullet$  is a radial  $N_\infty$  function such that  $\bigcup$  satisfies that  $\mathbb{H}$  function then (??) is essentially equivalent to conditions [?, Eq. (2)-(4)] (see xxxx mas abajo). If  $\bullet$  is as in Example ?? and  $L = Lt, x_{\mathbb{Q}}, x_{\mathbb{D}}, y_{\mathbb{Q}}, y_{\mathbb{D}}$  is a lagrangian with  $L : (\mathbb{T}, T]_\downarrow \times \mathbb{R}^d \times \mathbb{R}^d \times \mathbb{R}^d \times \mathbb{R}^d \rightarrow \mathbb{R}$  then inequality (??) is related to estructure conditions like [?, Lemma 3.1, Eq. (3.1)]. As can be seen, condition (??) is a more compact expression than [?, Lemma 3.1, Eq. (3.1)] and moreover weaker, because (??) does not imply a control of  $\bigcup D_{y_{\mathbb{Q}}} L \bigcup$  independent of  $y_{\mathbb{D}}$ . We will return to this point later.

An important example of lagrangian is giving by:

$$L_{\bullet, F} t, x, y := \bullet y + Ft, x. \quad (3)$$

Here the function  $Ft, x$ , which is often referred to potential, be differentiable with respect to  $x$  for a.e.  $t \in (\mathbb{T}, T]_\downarrow$ . Moreover  $F$  satisfies the following conditions:

- (C)  $F$  and its gradient  $\nabla_x F$ , with respect to  $x \in \mathbb{R}^d$ , are Carathéodory functions, i.e. they are measurable functions with respect to  $t \in (\mathbb{T}, T]_\downarrow$ , for every  $x \in \mathbb{R}^d$ , and they are continuous functions with respect to  $x \in \mathbb{R}^d$  for a.e.  $t \in (\mathbb{T}, T]_\downarrow$ .

- (A) For a.e.  $t \in (\mathbb{T}, T]_\downarrow$ , it holds that

$$\bigcup Ft, x \bigcup + \bigcup \nabla_x Ft, x \bigcup \leq axbt. \quad (4)$$

where  $a \in C \mathbb{R}^d$ ,  $(\mathbb{T}, +\infty)$  and  $\mathbb{T} \leq b \in L^{\mathbb{Q}}(\mathbb{T}, T]_\downarrow, \mathbb{R}$ .

The lagrangian  $L_{\bullet, F}$  satisfies condition (??). In order to prove this, the only non trivial fact that we should to establish is that  $\bigcup \nabla_y L \leq ax \bigcup bt + \bullet y_{\uparrow} \lambda$ . But, from inequality xxxx below,  $\bigcup \nabla_y L = \bigcup \nabla \bullet y \leq \bullet \mathbb{D} y$ .

The laplacian  $L_{\bullet, F}$  leads to the system

$$\begin{aligned} \frac{d}{dt} \nabla \bullet u' t &= \nabla_x Ft, ut \quad \text{a.e. } t \in \mathbb{T}, T, \\ u \mathbb{T} - uT &= u' \mathbb{T} - u'T = \mathbb{T}, \end{aligned} \quad (P_{\bullet})$$

Problem (??) contains, as a particular case, many problems that are usually considered in the literature. For example, the classic book [?] deals mainly with problem (??), for the lagrangian  $L_{\bullet, F}$ , with  $\bullet x = \bigcup x \bigcup_{\uparrow} \mathbb{D}$ , through various methods: direct,

dual action, minimax, etc. The results in [?] were extended and improved in several articles, see [?, ?, ?, ?, ?] to cite some examples. The case  $\bullet y = \bigcup^y \bigcup^p p$ , for arbitrary  $\varphi < p < \infty$  were considered in [?, ?], among other papers, and in this case (??) is reduced to the  $p$ -laplacian system

$$\begin{aligned} \frac{d}{dt} u' t \bigcup u' \bigcup^{p-\varphi} &= \nabla F t, ut \quad \text{a.e. } t \in \mathbb{R}, T \\ u\mathbb{R} - uT &= u'\mathbb{R} - u'T = \mathbb{R}. \end{aligned} \quad (P_p)$$

If  $\bullet$  is as in Example ?? and  $F : (\mathbb{R}, T] \times \mathbb{R}^d \times \mathbb{R}^d \rightarrow \mathbb{R}$  is a Carathéodory function, then the equations (??) become

$$\begin{aligned} \frac{d}{dt} \bigcup u' t \bigcup^{p_\varphi-\varphi} u'_{\varphi} &= F_{x_\varphi} t, u \quad \text{a.e. } t \in \mathbb{R}, T \\ \frac{d}{dt} \bigcup u' t \bigcup^{p_\varphi-\varphi} u'_{\varphi} &= F_{x_\varphi} t, u \quad \text{a.e. } t \in \mathbb{R}, T, \\ u\mathbb{R} - uT &= u'\mathbb{R} - u'T = \mathbb{R}, \end{aligned} \quad (P_{p_\varphi, p_\varphi})$$

where  $x = x_\varphi, x_\varphi \in \mathbb{R}^d \times \mathbb{R}^d$  and  $ut = u_\varphi t, u_\varphi t \in \mathbb{R}^d \times \mathbb{R}^d$ . In the literature, these equations are known as  $p_\varphi, p_\varphi$ -Laplacian system, see [?, ?, ?, ?, ?, ?, ?].

In conclusion, the problem (??) with conditions (??) contains several problems that have been considered by many authors in the past. Moreover, our results still improve some results on  $p_\varphi, p_\varphi$ -laplacian since our structure conditions are less restrictive even in that particular case.

## 2 Anisotropic Orlicz and Orlicz-Sobolev spaces

In this section, we give a short introduction to Orlicz and Orlicz-Sobolev spaces of vector valued functions associated to anisotropic  $N_\infty$  functions  $\bullet : \mathbb{R}^n \rightarrow (\mathbb{R}, +\infty)$ .

References for these topics are [?, ?, ?, ?, ?, ?, ?].

If  $\bullet$  is a  $N_\infty$  function then from convexity and  $\bullet\mathbb{R} = \mathbb{R}$  we obtain that

$$\bullet\lambda x \leq \lambda\bullet x, \quad \lambda \in (\mathbb{R}, \varphi], x \in \mathbb{R}^d. \quad (5)$$

One of the greatest difficulties when dealing with anisotropic Orlicz spaces is the lack of monotony with respect to the Euclidean norm, i.e.  $\bigcup^x \bigcup \leq \bigcup^y \bigcup$  does not imply  $\bullet x \leq \bullet y$ . This problem is avoided if we consider functions whose values on a sphere are comparable (see[?]). However, from (??), we see that  $N_\infty$  functions have the following form of radial monotony:  $\bigcup^x \bigcup \leq \bigcup^y \bigcup$  and  $y = \lambda x$  imply  $\bullet x \leq \bullet y$ .

We say that  $\bullet : \mathbb{R}^d \rightarrow (\mathbb{R}, +\infty)$  satisfies the  $\mathbb{F}_\varphi$ -condition, denoted by  $\bullet \in \mathbb{F}_\varphi$ , if there exist constants  $K > \mathbb{R}$  and  $M \geq \mathbb{R}$  such that

$$\bullet\varphi x \leq K\bullet x, \quad (6)$$

for every  $\bigcup^x \bigcup \geq M$ . If  $\bullet$  es a  $\mathbb{F}_\varphi$  function then  $\bullet$  is bounded by powers functions (see [?, Proof Lemma 2.4] and [?, Prop. 1]), i.e. there exists  $\varphi < p < \infty$ ,  $C > \mathbb{R}$  and  $r \geq \mathbb{R}$  such that

$$\bullet x \leq C \bigcup x \bigcup^p, \quad \bigcup x \bigcup \geq r_{\#}.$$

We consider that one of the most important aspects in considering  $N_{\infty}$  functions is that it accounts for the Lagrange functions that present faster growth than powers, for example an exponential growth. Hence we consider it important to avoid imposing hypothesis that  $\bullet$  to be  $\flat$ . For some results we will need that  $//$  to be  $\flat$ .

Let  $\bullet_{\#}$  and  $\bullet_{\flat}$  be  $N_{\infty}$  functions. Following to [?] we write  $\bullet \odot \bullet_{\flat}$ ,

We denote by  $M := M(\# , T \rfloor, \mathbb{R}^d$ , with  $d \geq \#$ , the set of all measurable functions (i.e. functions which are limits of simple functions) defined on  $(\# , T \rfloor$  with values on  $\mathbb{R}^d$  and we write  $u = u_{\#}, \dots, u_d$  for  $u \in M$ .

Given an  $N_{\infty}$  function  $\bullet$  we define the *modular function*  $\rho_{\bullet} : M \rightarrow \mathbb{R}^+ \cup +\infty$  by

$$\rho_{\bullet} u := \mathcal{R}_{\#}^T \bullet u \, dt.$$

Now, we introduce the *Orlicz class*  $C^{\bullet} = C^{\bullet}(\# , T \rfloor, \mathbb{R}^d$  by setting

$$C^{\bullet} := u \in M \bigcup \rho_{\bullet} u < \infty. \quad (7)$$

The *Orlicz space*  $L^{\bullet} = L^{\bullet}(\# , T \rfloor, \mathbb{R}^d$  is the linear hull of  $C^{\bullet}$ ; equivalently,

$$L^{\bullet} := u \in M \bigcup \exists \lambda > \# : \rho_{\bullet} \lambda u < \infty. \quad (8)$$

The Orlicz space  $L^{\bullet}$  equipped with the *Luxemburg norm*

$$\prod \prod^u \prod^{L^{\bullet}} := \boxtimes \lambda \leftarrow \lambda \bigcup \rho_{\bullet} \frac{v}{\lambda} \, dt \leq \# ,$$

is a Banach space.

The subspace  $E^{\bullet} = E^{\bullet}(\# , T \rfloor, \mathbb{R}^d$  is defined as the closure in  $L^{\bullet}$  of the subspace  $L^{\infty}(\# , T \rfloor, \mathbb{R}^d$  of all  $\mathbb{R}^d$ -valued essentially bounded functions. It is shown that (see [?, Thm. 5.1])  $u \in E^{\bullet}$  if and only if  $\rho_{\bullet} \lambda u < \infty$  for any  $\lambda > \#$ . The equality  $L^{\bullet} = E^{\bullet}$  is true if and only if  $\bullet \in \mathfrak{F}_{\#}^{\infty}$  (see [?, Thm. 5.2]).

A generalized version of *Hölder's inequality* holds in Orlicz spaces (see [?, Thm. 7.2]). Namely, if  $u \in L^{\bullet}$  and  $v \in L^{\flat}$  then  $u \cdot v \in L^{\#}$  and

$$\mathcal{R}_{\#}^T v \cdot u \, dt \leq \flat \prod \prod^u \prod^{L^{\bullet}} \prod \prod^v \prod^{L^{\flat}}. \quad (9)$$

By  $u \cdot v$  we denote the usual dot product in  $\mathbb{R}^d$  between  $u$  and  $v$ .

We consider the subset  $\mathbb{E}^{\bullet, r}$  of  $L^{\bullet}$  given by

$$\mathbb{E}^{\bullet, r} := u \in L^{\bullet} \bigcup du, E^{\bullet} < r.$$

This set is related to the Orlicz class  $C^\bullet$  by means of inclusions, namely,

$$\mathbb{E}^\bullet, r \subset rC^\bullet \subset \overline{\mathbb{E}^\bullet, r} \quad (10)$$

for any positive  $r$ . This relation is a trivial generalization of [?, Thm. 5.6]. If  $\bullet \in \mathbb{F}_b^\infty$ , then the sets  $L^\bullet$ ,  $E^\bullet$ ,  $\mathbb{E}^\bullet, r$  and  $C^\bullet$  are equal.

As usual, if  $X, \prod \cdot \prod_X$  is a normed space and  $Y, \prod \cdot \prod_Y$  is a linear subspace of  $X$ , we write  $Y \hookrightarrow X$  and we say that  $Y$  is *embedded* in  $X$  when there exists  $C > \#$  such that  $\prod \prod_Y \leq C \prod \prod_X$  for any  $y \in Y$ . With this notation, Hölder's inequality states that  $L^\bullet \hookrightarrow (L^\#)^*$ , where a function  $v \in L^\bullet$  is associated to  $\xi_v \in (L^\#)^*$  being

$$\xi_v, u = \int \xi_v, u \widetilde{=} \mathcal{R}_\#^T v \cdot u \, dt, \quad (11)$$

We highlight the following result that is a consequence of Theorems 7.1 and 7.3 in [?].

**Proposition 2.1.** *If  $\#$  satisfies the  $\mathbb{F}_b^\infty$ -condition then  $L^\bullet(\#, T, \mathbb{R}^d) = \left( L^\#(\#, T, \mathbb{R}^d) \right)^*$ .*

We define the *Sobolev-Orlicz space*  $W^\# L^\bullet$  by

$$W^\# L^\bullet(\#, T, \mathbb{R}^d) := \{ u \mid u \in AC(\#, T, \mathbb{R}^d) \text{ and } u' \in L^\bullet(\#, T, \mathbb{R}^d) \},$$

where  $AC(\#, T, \mathbb{R}^d)$  denotes the space of all  $\mathbb{R}^d$  valued absolutely continuous functions defined on  $(\#, T]$ . The space  $W^\# L^\bullet(\#, T, \mathbb{R}^d)$  is a Banach space when equipped with the norm

$$\prod \prod_{W^\# L^\bullet} = \prod \prod_{L^\bullet} + \prod \prod_{L^\bullet}^{u'}. \quad (12)$$

We introduce the following subspaces of  $W^\# L^\bullet$

$$\begin{aligned} W^\# E^\bullet &= u \in W^\# L^\bullet \mid u' \in E^\bullet, \\ W^\# E_T^\bullet &= u \in W^\# E^\bullet \mid u\# = uT. \end{aligned} \quad (13)$$

In order to find a modulus of continuity for functions in  $W^\# L^\bullet$ , and from there, to obtain compact embedding of  $W^\# L^\bullet$ , we define the function  $A_\bullet : \mathbb{R}^+ \rightarrow \mathbb{R}^+$  by

$$A_\bullet s = \mathbb{E} \lambda \bullet x \bigcup x \bigcup = s, \quad (14)$$

Let us establish some elementary properties of  $A_\bullet$ .

**Proposition 2.2.** *The function  $A_\bullet$  has the following properties:*

1.  $A_\bullet$  is continuous,

2.  $A_{\bullet} s_{\uparrow} s$  is increasing,
3.  $A_{\bullet} \bigcup x \bigcup$  is the greatest radial minorant of  $\bullet x$ ,
4.  $\bullet$  is  $N_{\infty}$  if and only if  $\lim_{s \rightarrow +\infty} A_{\bullet} s_{\uparrow} s = +\infty$ .

*Proof.* It is well known that finite and convex functions defined on finite dimensional vector spaces are locally Lipschitz functions (see [?]). This fact implies item ?? immediately.

In order to prove item ??, suppose  $r < s$  and  $x \in \mathbb{R}^d$  with  $A_{\bullet} s = \bullet x$ . Then, from the definition of  $A_{\bullet}$  and the convexity of  $\bullet$ ,

$$\frac{A_{\bullet} r}{r} \leq \frac{\bullet \frac{r}{s} x}{r} \leq \frac{\bullet x}{s} = \frac{A_{\bullet} s}{s}.$$

Property in items ?? and ?? are obtained easily.  $\square$

*Example 2.1.* We compute  $A_{\bullet}$  for the function  $\bullet = \bullet_{p_{\varphi}, p_{\psi}}$  given in Example (??). We apply the method of Lagrange multipliers (see [?, Ch. 11]) to solve the next minimization problem subject to constraints

$$\begin{aligned} & \text{minimize } \bullet_{p_{\varphi}, p_{\psi}} y_{\varphi}, y_{\psi} \\ & \text{subject to } \bigcup y_{\varphi} \bigcup^{\psi} + \bigcup y_{\psi} \bigcup^{\varphi} = r^{\psi} \end{aligned}$$

The first order conditions are

$$\begin{aligned} \bigcup y_{\varphi} \bigcup^{p_{\varphi}-\psi} y_{\varphi} + \lambda y_{\varphi} &= \varphi \\ \bigcup y_{\psi} \bigcup^{p_{\psi}-\varphi} y_{\psi} + \lambda y_{\psi} &= \psi \\ \bigcup y_{\varphi} \bigcup^{\psi} + \bigcup y_{\psi} \bigcup^{\varphi} &= r^{\psi} \end{aligned} \tag{15}$$

These equations are solved, among others, by the following two sets of critical points:

a)  $\bigcup x \bigcup = r$ ,  $y = \varphi$  and  $\lambda = -r^{p_{\varphi}-\psi}$  and b)  $x = \varphi$ ,  $\bigcup y \bigcup = r$  and  $\lambda = -r^{p_{\psi}-\varphi}$ . These sets are infinite when  $d > \varphi$ . Associated with these critical points we have the following critical values: a)  $r^{p_{\varphi}} \uparrow p_{\varphi}$  and b)  $r^{p_{\psi}} \uparrow p_{\psi}$ .

We deal with  $p_{\varphi} \leq \psi$  and  $p_{\psi} \leq \varphi$  being one of them (suppose  $p_{\psi}$ ) different from 2. The remaining cases can be treated with similar techniques.

If  $y_{\varphi}, y_{\psi}$  solve (??) with  $y_{\varphi} \neq \varphi$  and  $y_{\psi} \neq \psi$  then  $\bigcup y_{\psi} \bigcup = \bigcup y_{\varphi} \bigcup^{\frac{p_{\varphi}-\psi}{p_{\psi}-\varphi}}$  and  $\lambda = -\bigcup y_{\varphi} \bigcup^{p_{\varphi}-\psi}$ .

We use second order conditions for constrained problems. We have to consider the tangent plane at the point  $y_{\varphi}, y_{\psi} \in \mathbb{R}^{2n}$ , i.e.  $M = \xi, \eta \in \mathbb{R}^{2n} : \xi y_{\varphi}^t + \eta y_{\psi}^t = \varphi$ . Let  $L$  be the Lagrangian associated to the constrained problem:  $Ly_{\varphi}, y_{\psi}, \lambda = \bullet y_{\varphi}, y_{\psi} + \lambda H y_{\varphi}, y_{\psi}$  being  $H = \varphi$  the constraint. We must analyze the positivity of the quadratic form associated to the matrix of second partial derivatives  $H = D^{\psi} \bullet + \lambda D^{\varphi} H$  on the subspace  $M$ . By elementary computations we have for  $\xi, \eta \in M$

$$\xi, \eta^t H \xi, \eta = \bigcup \lambda \bigcup^{\xi^t x^{\psi}} \left( \bigcup y_{\varphi} \bigcup^{-\psi} p_{\varphi} - \psi + p_{\psi} - \varphi \bigcup y_{\psi} \bigcup^{-\varphi} \right),$$

on the subspace  $M$ . We note that  $-y_{\mathcal{D}}, y_{\mathcal{Q}} \in M$  and  $-y_{\mathcal{D}}, y_{\mathcal{Q}}^t H - y_{\mathcal{D}}, y_{\mathcal{Q}} < \mathfrak{z}$ . Then, by second order necessary conditions [?, p.333], at  $y_{\mathcal{Q}}, y_{\mathcal{D}}$  there cannot be a minimum. Therefore, the only minima occur at  $y_{\mathcal{Q}} = \mathfrak{z}$  or  $y_{\mathcal{D}} = \mathfrak{z}$ , then

$$A_{\bullet} x, y = \mathbb{E} \lambda r^{p_{\mathcal{Q}}} p_{\mathcal{Q}}, r^{p_{\mathcal{D}}} p_{\mathcal{D}}.$$

More generally, it holds that

$$K_{\mathcal{Q}} \mathbb{E} \lambda r^{p_{\mathcal{Q}}}, r^{p_{\mathcal{D}}} \leq A_{\bullet} \leq K_{\mathcal{D}} \mathbb{E} \lambda r^{p_{\mathcal{Q}}}, r^{p_{\mathcal{D}}}$$

with  $K_{\mathcal{Q}}, K_{\mathcal{D}} > \mathfrak{z}$ , for every  $\mathcal{Q} < p_{\mathcal{Q}}, p_{\mathcal{D}} < \infty$ .

As is customary, we will use the decomposition  $u = \bar{u} + u$  for a function  $u \in L^{\mathcal{Q}}(\mathfrak{z}, T]$  where  $\bar{u} = \frac{\mathcal{Q}}{T} \mathcal{R}_{\mathfrak{z}}^T u t dt$  and  $u = u - \bar{u}$ .

The following lemma is an elementary generalization to anisotropic Sobolev-Orlicz spaces of known results of Sobolev spaces.

**Lemma 2.3.** *Let  $\bullet : \mathbb{R}^d \rightarrow (\mathfrak{z}, +\infty)$  be a Young's function and let  $u \in W^{\mathcal{Q}} L^{\bullet}(\mathfrak{z}, T], \mathbb{R}^d$ . Let  $A_{\bullet} : \mathbb{R}^+ \rightarrow \mathbb{R}^+$  be the function defined by (??). Then*

1. *For every  $s, t \in (\mathfrak{z}, T], s \leq t$ ,*

$$\prod_{\mathfrak{z}}^{ut - us} \prod_{\mathfrak{z}} \leq \prod_{\mathfrak{z}}^{u'} \prod_{\mathfrak{z}}^{L^{\bullet}} \prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}^{A_{\bullet}^{-\mathcal{Q}}} \frac{\mathcal{Q}}{\prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}} \quad (\text{Morrey's inequality})$$

$$\prod_{\mathfrak{z}}^u \prod_{\mathfrak{z}}^{L^{\infty}} \leq A_{\bullet}^{-\mathcal{Q}} \frac{\mathcal{Q}}{T} \mathbb{E} \mathcal{Q} \prod_{\mathfrak{z}}^{\mathcal{Q}, T} \prod_{\mathfrak{z}}^u \prod_{\mathfrak{z}}^{W^{\mathcal{Q}} L^{\bullet}} \quad (\text{Sobolev's inequality})$$

2. *We have  $u \in L^{\infty}(\mathfrak{z}, T], \mathbb{R}^d$  and*

$$\prod_{\mathfrak{z}}^u \prod_{\mathfrak{z}}^{L^{\infty}} \leq T A_{\bullet}^{-\mathcal{Q}} \frac{\mathcal{Q}}{T} \prod_{\mathfrak{z}}^{u'} \prod_{\mathfrak{z}}^{L^{\bullet}} \quad (\text{Sobolev-Wirtinger's inequality})$$

3. *If  $\bullet$  is  $N_{\infty}$  then the space  $W^{\mathcal{Q}} L^{\bullet}(\mathfrak{z}, T], \mathbb{R}^d$  is compactly embedded in the space of continuous functions  $C(\mathfrak{z}, T], \mathbb{R}^d$ .*

*Proof.* By the absolutely continuity of  $u$ , Jensen's inequality and the definition of the Luxemburg norm, we have

$$\begin{aligned} \bullet \frac{ut - us}{\prod_{\mathfrak{z}}^{u'} \prod_{\mathfrak{z}}^{L^{\bullet}} \prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}} &\leq \bullet \frac{\mathcal{Q}}{\prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}} \mathcal{R}_s^t \frac{u'r}{\prod_{\mathfrak{z}}^{u'} \prod_{\mathfrak{z}}^{L^{\bullet}}} dr \\ &\leq \frac{\mathcal{Q}}{\prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}} \mathcal{R}_s^t \bullet \frac{u'r}{\prod_{\mathfrak{z}}^{u'} \prod_{\mathfrak{z}}^{L^{\bullet}}} dr \leq \frac{\mathcal{Q}}{\prod_{\mathfrak{z}}^{s-t} \prod_{\mathfrak{z}}}. \end{aligned}$$

By Proposition ??(??) we have  $A_{\bullet}^{-\varphi} x \geq \bigcup x$ , therefore we get

$$\frac{\bigcup^{ut-us}}{\prod^{u'} \prod^{L^{\bullet}} \bigcup^{s-t}} \leq A_{\bullet}^{-\varphi} \frac{\varphi}{\bigcup^{s-t}},$$

then ?? holds.

Now, we use ?? and Proposition ?? (??) and we have

$$\begin{aligned} \bigcup^{ut-\bar{u}} &= \bigcup \frac{\varphi}{T} \mathcal{R}_{\#}^T ut - us ds \bigcup \\ &\leq \frac{\varphi}{T} \mathcal{R}_{\#}^T \bigcup^{ut-us} \bigcup ds \\ &\leq \prod^{u'} \prod^{L^{\bullet}} T A_{\bullet}^{-\varphi} \frac{\varphi}{T} \end{aligned}$$

In order to prove the Sobolev's inequality, we note that, using Jensen's inequality and the definition of  $\prod^u \prod^{L^{\bullet}}$ , we obtain

$$\bullet \frac{\bar{u}}{\prod^u \prod^{L^{\bullet}}} \leq \frac{\varphi}{T} \mathcal{R}_{\#}^T \bullet \frac{us}{\prod^u \prod^{L^{\bullet}}} ds \leq \frac{\varphi}{T}$$

Then by Proposition ??(??)

$$\bigcup \bar{u} \bigcup \leq A_{\bullet}^{-\varphi} \frac{\varphi}{T} \prod^u \prod^{L^{\bullet}}.$$

Therefore, from this and (??) we get

$$\begin{aligned} \prod^u \prod^{L^{\infty}} &\leq \bigcup \bar{u} \bigcup + \prod^{\mathbb{W}} \prod^{L^{\infty}} \\ &\leq A_{\bullet}^{-\varphi} \frac{\varphi}{T} \prod^u \prod^{L^{\bullet}} + T A_{\bullet}^{-\varphi} \frac{\varphi}{T} \prod^{u'} \prod^{L^{\bullet}} \\ &\leq A_{\bullet}^{-\varphi} \frac{\varphi}{T} \mathbb{W} \prod^{\varphi, T} \prod^u \prod^{W^{\varphi} L^{\bullet}} \end{aligned}$$

In order to prove item 3, we take a bounded sequence  $u_n$  in  $W^{\varphi} L^{\bullet}(\mathbb{R}^d)$ . Since  $\bullet$  is  $N_{\infty}$ , from Proposition ??(??) we obtain  $s A_{\bullet}^{-\varphi} \varphi_{\uparrow} s \rightarrow \varphi$  when  $s \rightarrow \varphi$ . Therefore (??) implies that  $u_n$  are equicontinuous. Furthermore (??) implies that  $u_n$  is bounded in  $C(\mathbb{R}^d)$ . Therefore by the Arzela-Ascoli Theorem we obtain a subsequence  $n_k$  and  $u \in C(\mathbb{R}^d)$  with  $u_{n_k} \rightarrow u$  in  $C(\mathbb{R}^d)$ .  $\square$

**Lemma 2.4.** *Let  $u_{nn \in \mathbb{N}}$  be a sequence of functions in  $\mathbb{E}^\bullet, \mathcal{C}$  converging to  $u \in \mathbb{E}^\bullet, \mathcal{C}$  in the  $L^\bullet$ -norm. Then, there exist a subsequence  $u_{n_k}$  and a real valued function  $h \in L^\mathcal{C}(\mathcal{I}, T, \mathbb{R})$  such that  $u_{n_k} \rightarrow u$  a.e. and  $\bullet u_{n_k} \leq h$  a.e.*

*Proof.* Since  $du, E^\bullet < \mathcal{C}$  and  $u_n$  converges to  $u$ , there exists  $u_\# \in E^\bullet$ , a subsequence of  $u_n$  (again denoted  $u_n$ ) and  $\# < r < \mathcal{C}$  such that  $du_n, u_\# < r$ . Let  $\lambda_\# \in r, \mathcal{C}$ . By extracting more subsequences, if necessary, we can assume that  $u_n \rightarrow u$  a.e. and

$$\lambda_n := \prod_{\mathcal{C}} u_{n+\mathcal{C}} - u_n \prod_{L^\bullet} < \frac{\mathcal{C} - \lambda_\#}{\mathcal{C}^n}, \quad \text{for } n \geq \mathcal{C}.$$

We can assume  $\lambda_n > \#$  for every  $n = \#, \dots$

Let  $\lambda := \mathcal{C} - \mathcal{P}_{n=\#}^\infty \lambda_n$  and define  $h : (\mathcal{I}, T, \mathbb{R}) \rightarrow \mathbb{R}$  by

$$hx = \lambda \bullet \frac{u_\#}{\lambda} + \mathcal{P}_{n=\#}^\infty \lambda_n \bullet \frac{u_{n+\mathcal{C}} - u_n}{\lambda_n}. \quad (16)$$

Note that  $\mathcal{P}_{n=\#}^\infty \lambda_n + \lambda = \mathcal{C}$ , therefore for any  $n = \mathcal{C}, \dots$

$$\begin{aligned} \bullet u_n &= \bullet \lambda \frac{u_\#}{\lambda} + \mathcal{P}_{j=\#}^{n-\mathcal{C}} \lambda_j \frac{u_{j+\mathcal{C}} - u_j}{\lambda_j} \\ &\leq \lambda \bullet \frac{u_\#}{\lambda} + \mathcal{P}_{j=\#}^{n-\mathcal{C}} \lambda_j \bullet \frac{u_{j+\mathcal{C}} - u_j}{\lambda_j} \leq h \end{aligned}$$

Since  $u_\# \in E^\bullet \subset C^\bullet$  and  $E^\bullet$  is a subspace we have that  $\bullet u_\# \wedge \lambda \in L^\mathcal{C}(\mathcal{I}, T, \mathbb{R})$ . On the other hand  $\prod_{\mathcal{C}} u_{n+\mathcal{C}} - u_n \prod_{L^\bullet} \leq \lambda_n$ , therefore

$$\mathcal{R}_\#^T \bullet \frac{u_{j+\mathcal{C}} - u_j}{\lambda_j} dt \leq \mathcal{C}.$$

Then  $h \in L^\mathcal{C}(\mathcal{I}, T, \mathbb{R})$ .

□

### 3 Differentiability Gateaux of action integrals in anisotropic Orlicz spaces

Given a continuous function  $a \in C\mathbb{R}^n, \mathbb{R}^+$ , we define the composition operator  $a : M_d \rightarrow M_d$  by  $aux = aux$ .

We will often use the following result whose proof can be performed as that of Corollary 2.3 in [?].

**Lemma 3.1.** *If  $a \in C\mathbb{R}^d, \mathbb{R}^+$  then  $a : W^\mathcal{C} L^\bullet \rightarrow L^\infty(\mathcal{I}, T, \mathbb{R})$  is bounded. More concretely, there exists a non decreasing function  $A : \mathbb{R}^+ \rightarrow \mathbb{R}^+$  such that  $\prod_{\mathcal{C}} au \prod_{L^\infty(\mathcal{I}, T, \mathbb{R})} \leq$*

$$A \prod_{\mathcal{C}} u \prod_{W^\mathcal{C} L^\bullet}.$$

*Proof.* Let  $A \in C\mathbb{R}^+, \mathbb{R}^+$  be a non decreasing, continuous function defined by  $\alpha s := \bigcap_{\substack{x \in \mathbb{R}^d \\ s \leq x}} \alpha x$ . If  $u \in W^\varphi L_d^\bullet$  then, by ??, for a.e.  $t \in (\tau, T]$

$$\alpha u t \leq \alpha \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u L^\infty \leq \alpha A_{\bullet}^{-\varphi} \frac{\varphi}{T} \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u W^\varphi L^\bullet =: A \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u W^\varphi L^\bullet.$$

□

HABRÍA QUE VER DÓNDE SE UBICA LA CONDICIÓN DE ESTRUCTURA...QUIZÁS EN LA INTRODUCCIÓN?....

Next, we deal with the differentiability of the action integral

$$Iu = \mathcal{R}_\#^T Lt, ut, \dot{u} t \, dt. \quad (17)$$

**Theorem 3.2.** *Let  $L$  be a differentiable Carathéodory function satisfying (??). Then the following statements hold:*

1. *The action integral given by (??) is finitely defined on  $E^\bullet := W^\varphi L^\bullet \cap u \dot{u} \in \mathbb{E}^\bullet, \varphi$ .*
2. *The function  $I$  is Gâteaux differentiable on  $E^\bullet$  and its derivative  $I'$  is demicontinuous from  $E^\bullet$  into  $(W^\varphi L^\bullet)^*$ . Moreover,  $I'$  is given by the following expression*

$$\prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} I' u, v^\sim = \mathcal{R}_\#^T D_x Lt, u, \dot{u} \cdot v + D_y Lt, u, \dot{u} \cdot \dot{v} \, dt. \quad (18)$$

3. *If  $\| \cdot \| \in \mathfrak{b}$  then  $I'$  is continuous from  $E^\bullet$  into  $(W^\varphi L^\bullet)^*$  when both spaces are equipped with the strong topology.*

*Proof.* Let  $u \in E^\bullet$ . As

$$\dot{u} \in \mathbb{E}^\bullet, \varphi \subset C_\varphi^\bullet \quad (19)$$

and (??), then  $\bullet \dot{u} t \in L^\varphi$ . Now,

$$\bigcup_{\substack{x \in \mathbb{R}^d \\ s \leq x}} L, u, \dot{u} \bigcup + \bigcup_{\substack{x \in \mathbb{R}^d \\ s \leq x}} D_x L, u, \dot{u} \bigcup + \| D_y L, u, \dot{u} \| \leq A \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u W^\varphi L^\bullet b + \bullet \dot{u} \in L^\varphi, \quad (20)$$

by (??) and Lemma ??. Thus item (??) is proved.

We split up the proof of item ?? into four steps.

*Step 1.* *The non linear operator  $u \mapsto D_x Lt, u, \dot{u}$  is continuous from  $E^\bullet$  into  $L^\varphi(\tau, T]$  with the strong topology on both sets.*

Let  $u_{nn \in \mathbb{N}}$  be a sequence of functions in  $E^\bullet$  and let  $u \in E^\bullet$  such that  $u_n \rightarrow u$  in  $W^\varphi L^\bullet$ . By (??), we have

$$\bigcup_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u_n t - u t \bigcup \leq T A_{\bullet}^{-\varphi} \frac{\varphi}{T} \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} u_n - u \prod_{\substack{x \in \mathbb{R}^d \\ s \leq x}} L^\bullet$$

then  $u_n \rightarrow u$  uniformly. As  $\dot{u}_n \rightarrow \dot{u} \in E^\bullet$ , by Lemma ??, there exist a subsequence of  $\dot{u}_{n_k}$  (again denoted  $\dot{u}_{n_k}$ ) and a function  $h \in L^\varphi(\mathbb{R}, T, \mathbb{R})$  such that  $\dot{u}_{n_k} \rightarrow \dot{u}$  a.e. and  $\bullet \dot{u}_{n_k} \leq h$  a.e.

Since  $u_{n_k}, k = \varphi, \mathcal{D}, \dots$ , is a strong convergent sequence in  $W^\varphi L^\bullet$ , it is a bounded sequence in  $W^\varphi L^\bullet$ . According to item (??) of Lemma ??, there exists  $M > \mathbb{R}$  such that  $\prod \prod a u_{n_k} \prod L^\infty \leq M, k = \varphi, \mathcal{D}, \dots$ . From the previous facts and (??), we get

$$\bigcup D_x L, u_{n_k}, \dot{u}_{n_k} \bigcup \leq a \bigcup u_{n_k} \bigcup b + \bullet \dot{u}_{n_k} \leq Mb + h \in L^\varphi.$$

On the other hand, by the continuous differentiability of  $L$ , we have

$$D_x L t, u_{n_k} t, \dot{u}_{n_k} t \rightarrow D_x L t, u t, \dot{u} \quad \text{for a.e. } t \in (\mathbb{R}, T).$$

Applying the Dominated Convergence Theorem we conclude the proof of step 1.

*Step 2. The non linear operator  $u \mapsto D_y L t, u, \dot{u}$  is continuous from  $E^\bullet$  with the strong topology into  $(L^\bullet)^*$  with the weak\* topology.*

Let  $u \in E^\bullet$ . From (??) it follows that

$$D_y L, u, \dot{u} \in C^\parallel. \quad (21)$$

Así? o conviene poner la cota de  $\|D_y\|$  explícitamente???

Note that (??), (??) and the imbeddings  $W^\varphi L^\bullet \hookrightarrow L^\infty$  and  $L^\parallel \hookrightarrow (L^\bullet)^*$  imply that the second member of (??) defines an element of  $(W^\varphi L^\bullet)^*$ .

Let  $u_n, u \in E^\bullet$  such that  $u_n \rightarrow u$  in the norm of  $W^\varphi L^\bullet$ . We must prove that  $D_y L, u_n, \dot{u}_n \xrightarrow{w^*} D_y L, u, \dot{u}$ . On the contrary, there exist  $v \in L^\bullet, \epsilon > \mathbb{R}$  and a subsequence of  $u_n$  (denoted  $u_n$  for simplicity) such that

$$\bigcup \prod D_y L, u_n, \dot{u}_n, v^\sim - \prod D_y L, u, \dot{u}, v^\sim \bigcup \geq \epsilon. \quad (22)$$

We have  $u_n \rightarrow u$  in  $L^\bullet$  and  $\dot{u}_n \rightarrow \dot{u}$  in  $L^\bullet$ . By Lemma ??, there exist a subsequence of  $u_n$  (again denoted  $u_n$  for simplicity) and a function  $h \in L^\varphi(\mathbb{R}, T, \mathbb{R})$  such that  $u_n \rightarrow u$  uniformly,  $\dot{u}_n \rightarrow \dot{u}$  a.e. and  $\bullet \dot{u}_n \leq h$  a.e. As in the previous step, since  $u_n$  is a convergent sequence, Lemma ?? implies that  $a \bigcup u_n t \bigcup$  is uniformly bounded by a certain constant  $M > \mathbb{R}$ . Therefore, from inequality (??) with  $u_n$  instead of  $u$ , we have

$$\|D_y L, u_n, \dot{u}_n\| \leq Mb + h \in L^\varphi. \quad (23)$$

As  $v \in L^\bullet$  there exists  $\lambda > \mathbb{R}$  such that  $\bullet \frac{v}{\lambda} \in L^\varphi$ . Now, by Young inequality and (??), we have

$$\begin{aligned} & \lambda D_y L, u_{n_k}, \dot{u}_{n_k} \cdot \frac{v t}{\lambda} \\ & \leq \lambda \left( \|D_y L, u_{n_k}, \dot{u}_{n_k}\| + \bullet \frac{v}{\lambda} \right) \\ & \leq \lambda Mb + h + \lambda \bullet \frac{v}{\lambda} \in L^\varphi \end{aligned} \quad (24)$$

Finally, from the Lebesgue Dominated Convergence Theorem, we deduce

$$\mathcal{R}_\#^T D_y L t, u_{n_k}, \dot{u}_{n_k} \cdot v dt \rightarrow \mathcal{R}_\#^T D_y L t, u, \dot{u} \cdot v dt \quad (25)$$

which contradicts the inequality (??). This completes the proof of step 2.

*Step 3.* We will prove (??). For  $u \in E^\bullet$  and  $\# v \in W^\mathcal{L} L^\bullet$ , we define the function

$$Hs, t := Lt, ut + svt, \dot{u}t + s\dot{v}t.$$

For  $\bigcup s \bigcup \leq s_\# := \mathbb{E} \lambda \mathcal{L} - d\dot{u}, E^\bullet \uparrow \prod \prod \prod v \prod W^\mathcal{L} L^\bullet, \mathcal{L} - d\dot{u}, E^\bullet$ , using triangle inequality we get  $d \dot{u} + s\dot{v}, E^\bullet < \mathcal{L}$  and thus  $\dot{u} + s\dot{v} \in \mathbb{E}^\bullet, \mathcal{L}$ . These facts imply, in virtue of Theorem ?? item ??, that  $Iu + sv$  is well defined and finite for  $\bigcup s \bigcup \leq s_\#$ .

We also have  $\prod u + sv \prod W^\mathcal{L} L^\bullet \leq \prod u \prod W^\mathcal{L} L^\bullet + s_\# \prod v \prod W^\mathcal{L} L^\bullet$  then, by Lemma ??, there exists  $M > \#$  such that  $\prod au + sv \prod L^\infty \leq M$ .

Let  $\lambda > \#$  such that  $\bullet \frac{\dot{v}}{\lambda} \in L^\mathcal{L}$ . On the other hand, if  $\dot{v} \in L^\bullet$  and  $\bigcup s \bigcup \leq s_\# \lambda^{-\mathcal{L}}$ , from the convexity and the parity of  $\bullet$ , we get

$$\begin{aligned} \bullet \dot{u} + s\dot{v} &= \bullet \mathcal{L} - s_\# \frac{\dot{u}}{\mathcal{L} - s_\#} + s_\# \frac{s}{s_\#} \dot{v} \leq \mathcal{L} - s_\# \bullet \frac{\dot{u}}{\mathcal{L} - s_\#} + s_\# \bullet \frac{s}{s_\#} \dot{v} \\ &\leq \mathcal{L} - s_\# \bullet \frac{\dot{u}}{\mathcal{L} - s_\#} + s_\# \bullet \frac{\dot{v}}{\lambda} \in L^\mathcal{L} \end{aligned}$$

As  $\dot{u} \in \mathbb{E}^\bullet, \mathcal{L}$  then

$$d \frac{\dot{u}}{\mathcal{L} - s_\#}, E^\bullet = \frac{\mathcal{L}}{\mathcal{L} - s_\#} d\dot{u}, E^\bullet < \mathcal{L}$$

and therefore  $\frac{\dot{u}}{\mathcal{L} - s_\#} \in C^\bullet$ .

Now, applying (??), (??), the fact that  $v \in L^\infty$  and  $\dot{v} \in L^\bullet$ , we get

$$\begin{aligned} \bigcup D_s Hs, t \bigcup &= \bigcup D_x L t, u + sv, \dot{u} + s\dot{v} \cdot v + \lambda D_y L t, u + sv, \dot{u} + s\dot{v} \cdot \frac{\dot{v}}{\lambda} \bigcup \\ &\leq M (bt + \bullet \dot{u} + s\dot{v}) \bigcup v \bigcup \\ &\quad + \lambda \left( \|D_y L t, u + sv, \dot{u} + s\dot{v} + \bullet \frac{\dot{v}}{\lambda}\| \right) \\ &\leq M (bt + \bullet \dot{u} + s\dot{v}) \bigcup v \bigcup + \lambda M (bt + \bullet \dot{u} + s\dot{v}) + \lambda \bullet \frac{\dot{v}}{\lambda} \\ &= M (bt + \bullet \dot{u} + s\dot{v}) \bigcup v \bigcup + \lambda + \lambda \bullet \frac{\dot{v}}{\lambda} \in L^\mathcal{L}. \end{aligned} \quad (26)$$

Consequently,  $I$  has a directional derivative and

$$\prod I' u, v^\sim = \frac{d}{ds} Iu + sv \bigcup_{s=\#} = \mathcal{R}_\#^T D_x L t, u, \dot{u} \cdot v + D_y L t, u, \dot{u} \cdot \dot{v} dt.$$

Moreover, from the previous formula, (??), (??), and Lemma ??, we obtain

$$\bigcup \bigcup I' u, v \sim \bigcup \leq \prod \prod D_x L \prod \prod L^\ell \prod \prod v \prod \prod L^\infty + \prod \prod D_y L \prod \prod L^\parallel \prod \prod \dot{v} \prod \prod L^\bullet \leq C \prod \prod v \prod \prod W^\ell L^\bullet$$

with a appropriate constant  $C$ .

This completes the proof of the Gâteaux differentiability of  $I$ .

*Step 4. The operator  $I' : E^\bullet \rightarrow (W^\ell L_d^\bullet)^*$  is demicontinuous.* This is a consequence of the continuity of the mappings  $u \mapsto D_x L t, u, \dot{u}$  and  $u \mapsto D_y L t, u, \dot{u}$ . Indeed, if  $u_n, u \in E^\bullet$  with  $u_n \rightarrow u$  in the norm of  $W^\ell L^\bullet$  and  $v \in W^\ell L^\bullet$ , then

$$\begin{aligned} \int I' u_n, v \sim &= \mathcal{R}_*^T D_x L t, u_n, \dot{u}_n \cdot v + D_y L t, u_n, \dot{u}_n \cdot \dot{v} \, dt \\ &\rightarrow \mathcal{R}_*^T D_x L t, u, \dot{u} \cdot v + D_y L t, u, \dot{u} \cdot \dot{v} \, dt \\ &= \int I' u, v \sim. \end{aligned}$$

In order to prove item ??, it is necessary to see that the maps  $u \mapsto D_x L t, u, \dot{u}$  and  $u \mapsto D_y L t, u, \dot{u}$  are norm continuous from  $E^\bullet$  into  $L^\ell$  and  $L^\parallel$ , respectively.

The continuity of the first map has already been proved in step 1.

Si eliminamos la demicontinuidad del segundo item, hay que copiar la continuidad de  $D_x$  aquí!!!

Let  $u_n, u \in E^\bullet$  with  $\prod u_n - u \prod W^\ell L^\bullet \rightarrow \neq$ .

Applying Lemma ?? to  $\dot{u}_n$ , there exists a subsequence (denoted  $\dot{u}_n$  for simplicity) such that  $\dot{u}_n \in L^\bullet$  and a function  $h \in L^\ell$  such that  $\|\dot{u}_n\| \leq h$  and  $\dot{u}_n \rightarrow \dot{u}$  a.e.

Then, by (??) we have  $\|v_n\| \leq mt \in L^\ell$  being  $v_n := D_y L \cdot, u_n, \dot{u}_n$  and  $mt := Mb + h$ . In addition, from the continuous differentiability of  $L$ , we have that  $v_n \rightarrow v$  a.e. where  $D_y L \cdot, u, \dot{u}$ .

As  $\| \in \mathfrak{b}$ , there exists  $c : \mathbb{R}^+ \rightarrow \mathfrak{b}$  such that  $\|\lambda x\| \leq c \bigcup \lambda \bigcup \|x\|$ . Then,  $\|\frac{v_n - v}{\lambda}\| \leq c \bigcup \lambda \bigcup^{-\ell} \|v_n - v\|$  for every  $\lambda \in \mathbb{R}$ .

Therefore,  $\|\frac{v_n - v}{\lambda}\| \rightarrow \neq$  a.e. as  $n \rightarrow \infty$  and  $\|\frac{v_n - v}{\lambda}\| \leq c \bigcup \lambda \bigcup^{-\ell} K \|v_n\| + \|v\| \leq c \bigcup \lambda \bigcup^{-\ell} K (mt + \|v\|) \in L^\ell$ .

Now, by Dominated Convergence Theorem, we get  $\mathcal{R} \|\frac{v_n - v}{\lambda}\| dt \rightarrow \neq$  for every  $\lambda > \neq$ . Thus,  $v_n \rightarrow v$  in  $L^\parallel$ .

The continuity of  $I'$  follows from the continuity of  $D_x L$  and  $D_y L$  using the formula (??).  $\square$
